

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions and listing of claims in the application.

LISTING OF CLAIMS

1. (Previously Presented) A recording head for generating an optical near field and thermo-magnetically recording information on a recording medium, comprising:
 - a light source;
 - a first magnetic pole for applying a magnetic field to the recording medium; and
 - a diffuser that generates an optical near field in the vicinity of the recording mediumwhen light is radiated from the light source, wherein:
 - the diffuser is in contact with the first magnetic pole and a face from which light from the light source irradiates is substantially perpendicular to the recording medium.
2. (Original) A recording head according to Claim 1, wherein:
 - the diffuser is arranged between a direction in which light from the light source is outgoing and the first magnetic pole with the back of the face which the light irradiates in contact with the first magnetic pole.
3. (Original) A recording head according to Claim 1, further comprising:
 - a second magnetic pole different from the first magnetic pole, wherein:
 - the diffuser is arranged between the light source and the second magnetic pole.
4. (Original) A recording head according to Claim 3, wherein:
 - the diffuser is arranged between the first magnetic pole and the second magnetic pole with the face which light irradiates of the diffuser in contact with the first magnetic pole.
5. (Original) A recording head according to Claim 3, wherein:

the second magnetic pole is formed so that it is substantially perpendicular to the recording medium and is substantially orthogonal to a scanning direction.

6. (Original) A recording head according to Claim 1, wherein:
the diffuser is substantially an isosceles triangle; and
the diffuser is installed with its vertex between two sides equal in the length opposite to the recording medium.
7. (Original) A recording head according to Claim 1, wherein:
the diffuser is made of any of Au, Pd, Pt, Rh and Ir or an alloy of these.
8. (Original) A recording head according to Claim 3, wherein:
one end of the first magnetic pole is connected to the second magnetic pole;
the other end reaches the bottom of the recording head; and
the first magnetic pole is opposite to the information recording medium.
9. (Previously Presented) An information recording/reading apparatus for
generating an optical near field and thermo-magnetically recording/reading information on a
recording medium, comprising:
a light source;
a magnetic pole for applying a magnetic field to the recording medium; and
a diffuser that generates an optical near field when the diffuser receives light from the
light source, wherein:
the diffuser is in contact with the magnetic pole and a face from which light from the
light source irradiates is substantially perpendicular to the recording medium; and
magnetic flux detection means that detects a magnetic flux of the recording medium.
10. (Original) An information recording/reading apparatus according to Claim 9,
further comprising:

Serial No. 10/697,094

NIT-400

Response to Office Action mailed February 9, 2006

scanning means so that the diffuser and the magnetic flux detection means scan a desired position of the recording medium.
